

# ECONOMICAL WHITEWASH POWDER FOR GREENHOUSES

-  **Very cost effective**
-  **Does not harm the greenhouse structure**
-  **Lasts up to 2 months, depending on weather**
-  **Wears off gradually, cannot be removed with Topclear**

## WHAT

Sombrero powder is a cost effective shading product that is used for applying a temporary shade layer on greenhouses. It forms an efficient white barrier against too much heat and sunlight that can be used on all types of greenhouses around the world. The layer has a good wear resistance up to 2 months on which a second layer can be applied if necessary. The shading will wear off gradually, which means that the shading effect is reduced slowly and there is no need for a cleaning product.

## WHY

During spring and summer time the light level and temperature increases. To benefit the production of the crops, they need to be protected against excess heat and light. Shading with Sombrero powder will prevent the plant from stress, burning of fruits, scorching and loss of production.

## USAGE

Sombrero powder has to be mixed with clean water. The shading percentage depends on dilution ratio and number of bags per hectare. Product should be applied during dry weather and allowed to dry. A simple hand sprayer can be used. When properly mixed, it does not clog or harm the pump. Sombrero powder works on plastic film, polycarbonate, acrylic and glass.

For more detailed information about applications and dosage visit [www.sudlac.com](http://www.sudlac.com)

Amount of Sombrero		Amount of water		Total amount of spraying liquid		Shading percentage
Bags per hectare*	Bags per acre*	Liter	US gal	Liter per ha	US gal per acre	
7	3	1860	194	2000	210	40 - 50%
9	4	1820	189	2000	210	55 - 60%
12	5	1760	184	2000	210	65 - 70%

\*When applied manually at 2000 L (210 US gal) of spraying liquid per ha
